

HEST Alignment

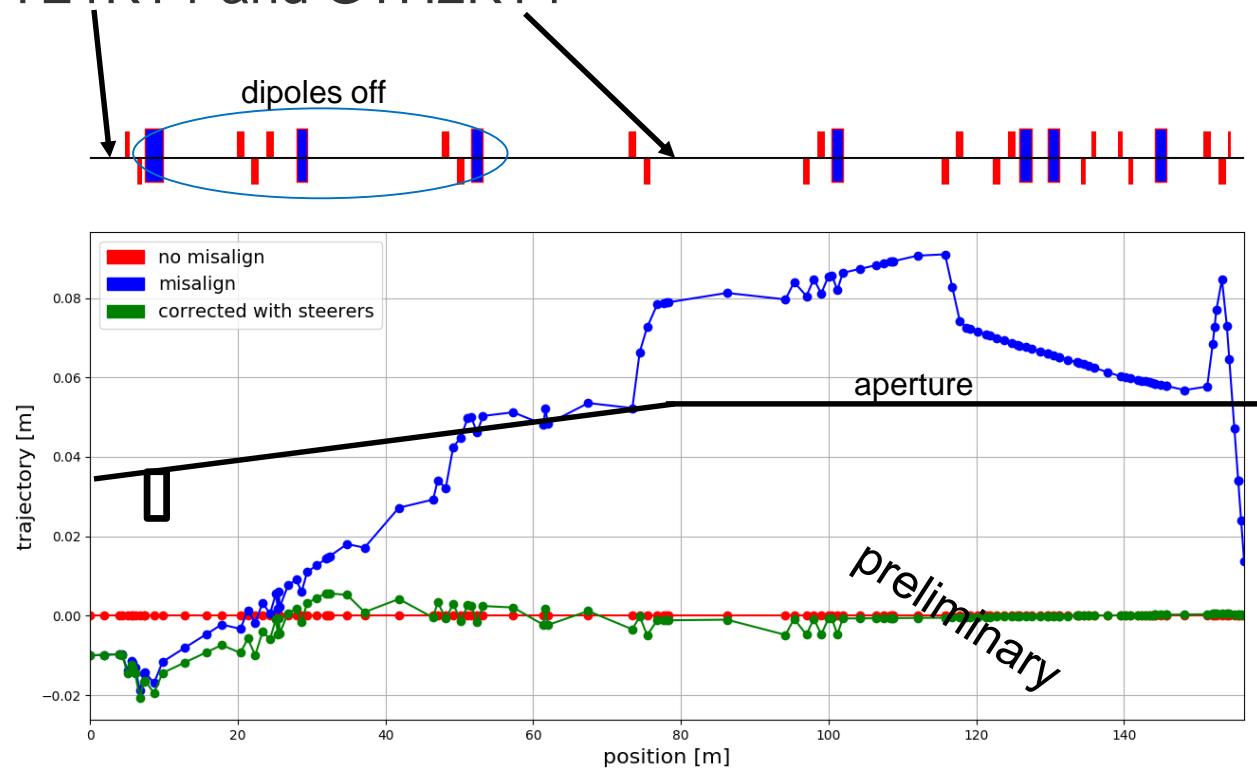

May 8th, 2018
m.sapinski@gsi.de

Survey – TH line

TH line – MADX correction

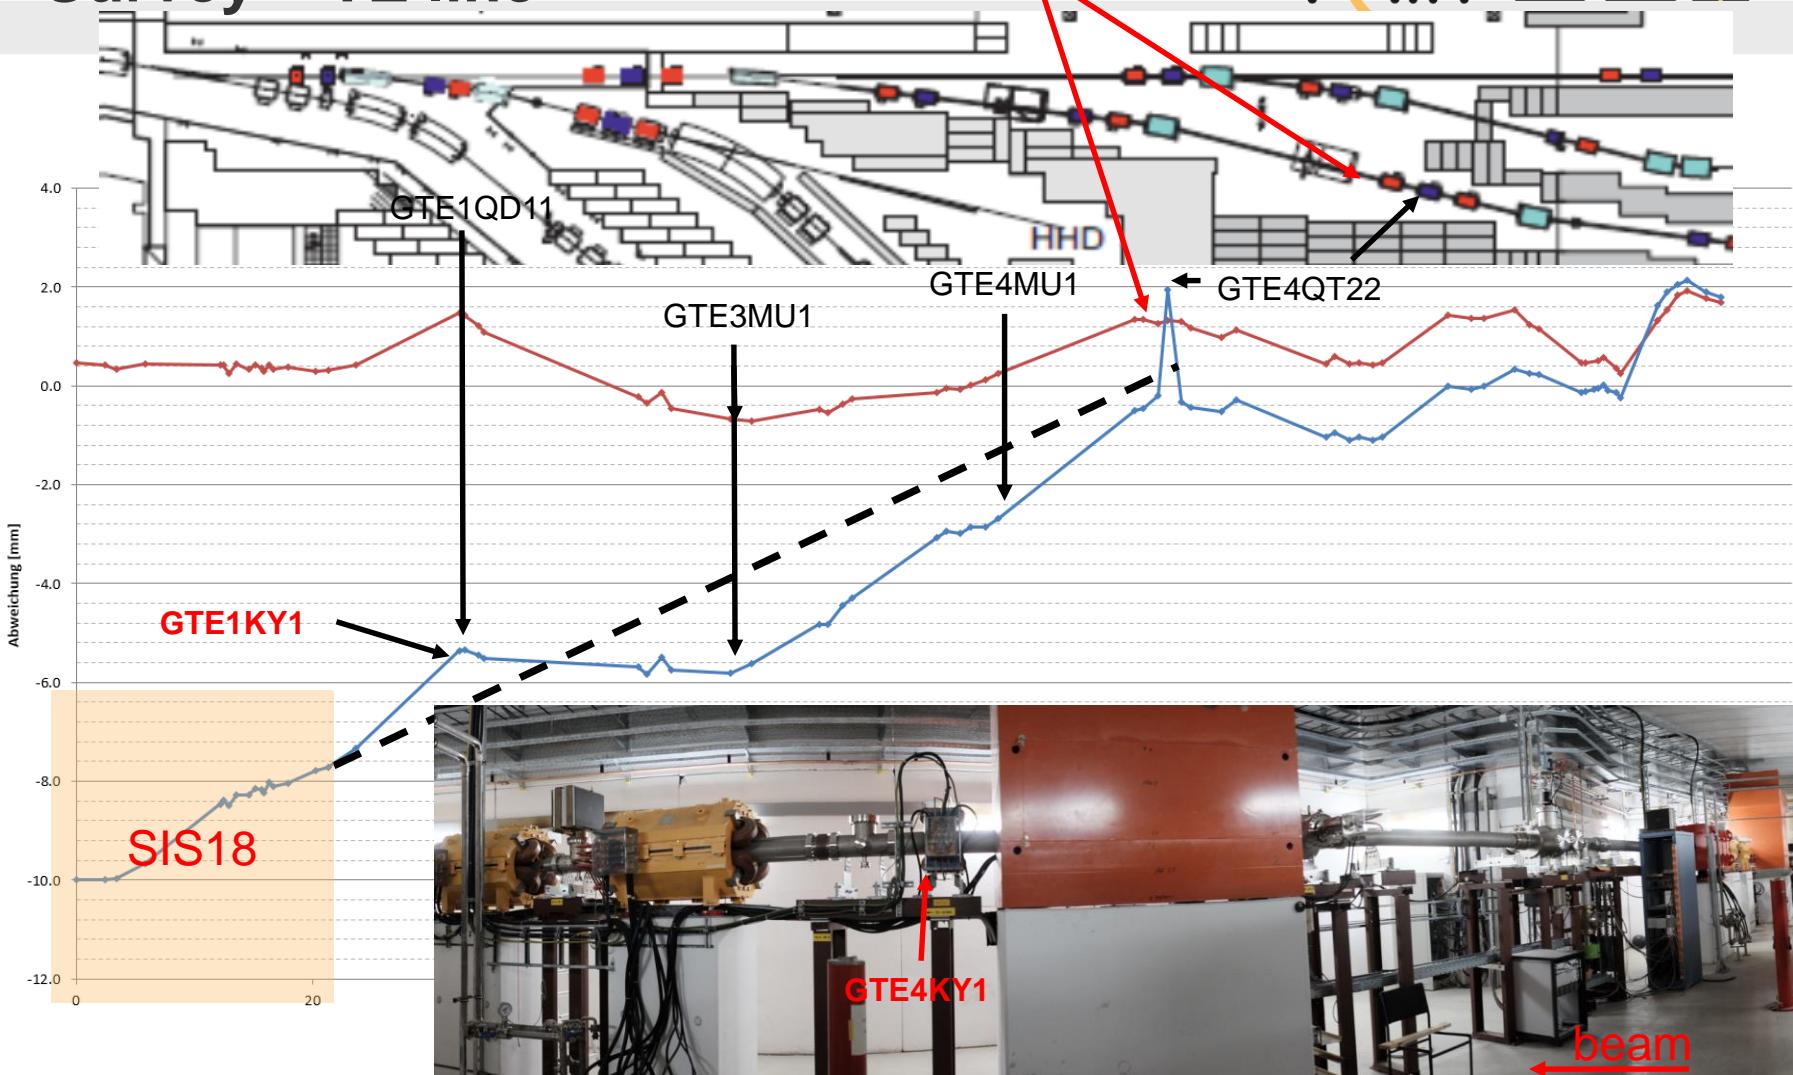

- based on HADES optics, using only two steerers:
GTE1KY1 and GTH2KY1

GTE1QD12: -11 mm

GTS1MU1: -10 mm, misalign = -8 mm, half-aperture = 35 mm,
expected 2 sigma beam envelope: 10 mm (MIRKO)

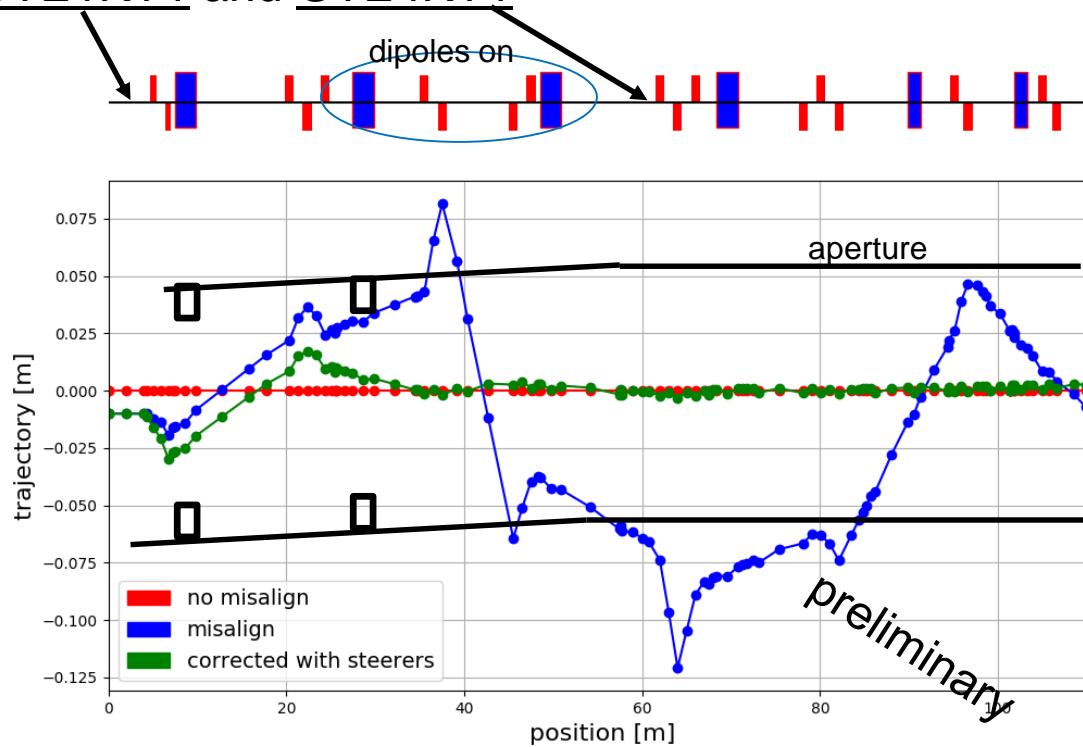

Survey – TE line

TE line – MADX correction

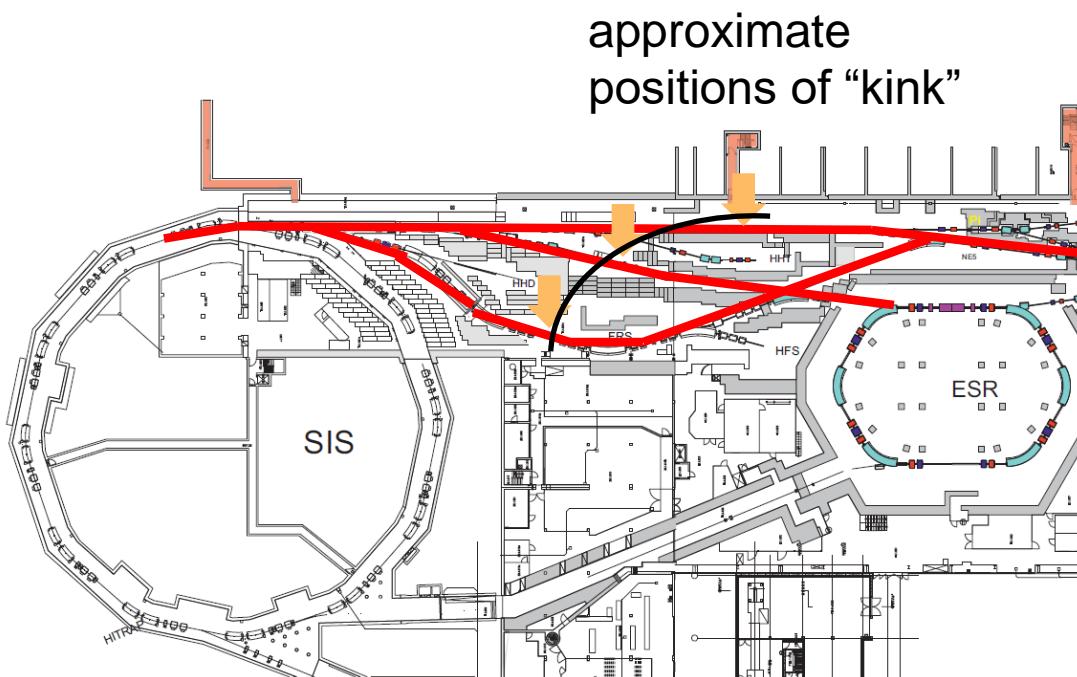

ESR injection optics, affected between steerers:

GTE1KY1 and GTE4KY1

MADX matching needs to adjust more magnets to achieve reasonable trajectory – to be investigated.

Floor cracking?

- Observation: floor maybe cracked
 - there seems to be more cracks in the “kink” zone

Conclusions and alignment strategy

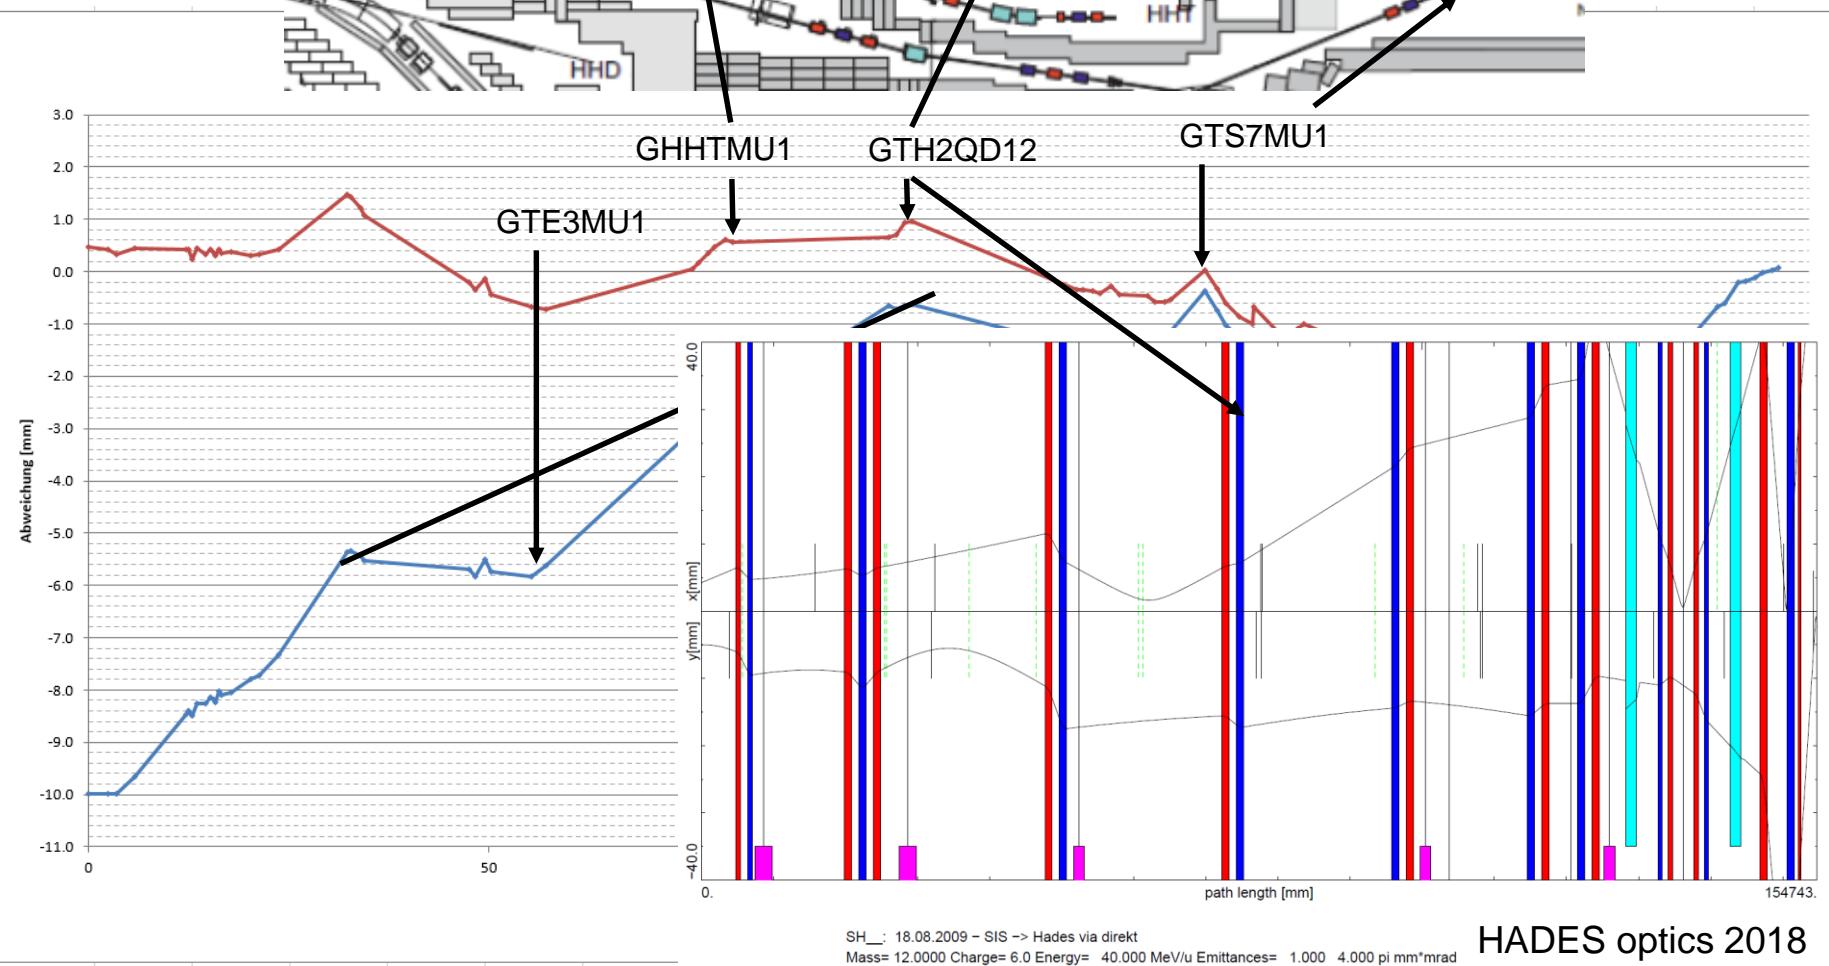

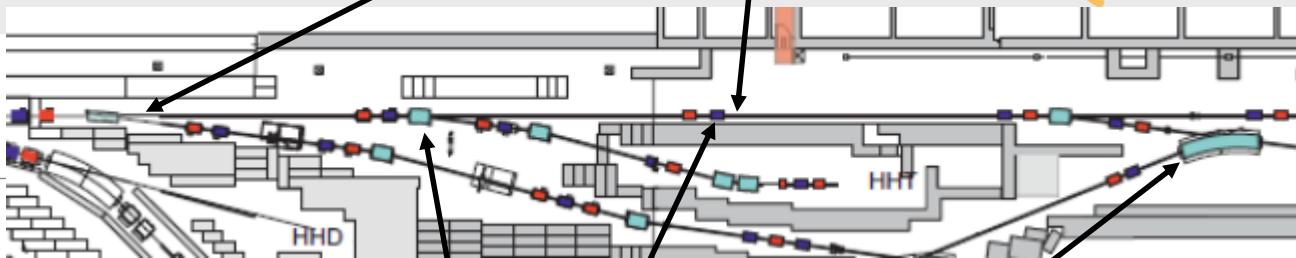

- We can deal with misalignment using existing steerers.
- Our *alignment reference lines* should be a straight extension of SIS18 new reference plane.
- Good alignment is especially important at the beginning of the line; suggested alignments:
 - GTE1QD11: -0.5 mm (vertically defocusing),
 - GTE3MU1 0.5 mm up (vertical aperture is small).
- In addition: GTE4QT22 shows “funny” 1 mm misalignment – verify and correct
- Include the correction in survey data, which afterwards are used to model the optics.
