

## **HEST** news

- Last week: all equipment on HADES checked (again)
- Water leak detected (tbc)
- Investigation of BioRem alarms:
  - Pos A: losses behind the pion target, probably close to the bend GHADMU1
  - Pos A: BioRem close to wall opening for cable trays
  - Pos B: inside HHT cave, why neutrons there? Coming from GTH3MU1 (small vertical aperture, losses often observed in the past)? GHHTMU1 (see next slide)?

## **BioRem alarm mitigations**

FAIR ESSI

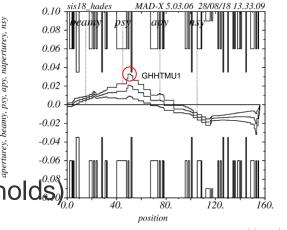

- Pos A and B:
  - open vacuum chambers and check for obstacles (vacuum sectors TH2, HAD1, what about HAD2?) - week 37
  - optimize the optics (partly done)
  - increase BioRem averaging time?
- Pos A:
  - close the opening for cables

vacuum opened during last shutdown

Pos B:

put NE6 in Operation (=increase thresholds

envelope

exaggerated
