

Beam lines - progress report

Mariusz Sapinski*

CERN, March 20, 2020

* GSI and SEEIIST

Beamlines with building

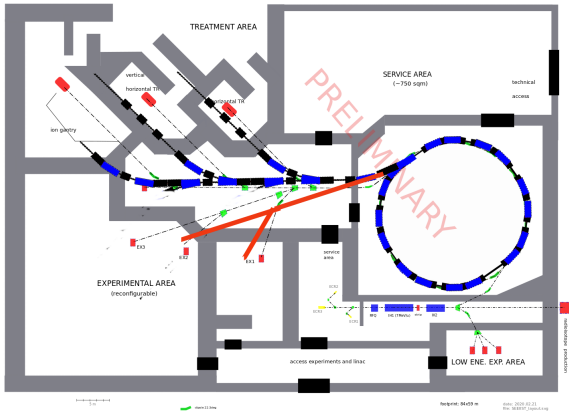

- positions of treatment rooms is OK, but the scanning branches are very long, investigate
- it is difficult to have experimental area in the place we planned, it should be more downstream

Beamlines with building

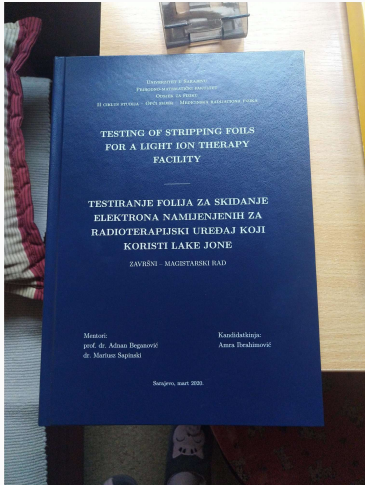

- this is simpler to build and to operate
- missing dump and vertical beamline

If we want extreme compact

- no dispersion suppression for the straight line
- another dipole, towards the end of the straight line, useful for safety

Other news

- Amra's thesis is printed
- defense on March 31
